

BorrellyTM
SPRING WASHERS

SPRING FOR INNOVATION

Borrely
SPRING WASHERS™

Concentrated energy™

CONTENTS

4 INTRODUCTION

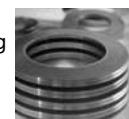

Always striving to innovate • High-tech expertise • An extensive range of spring washers

8 INSPECTION AND SHIPPING

A fully equipped inspection laboratory • The importance of packaging

25 BELLEVILLE WASHERS

Custom analyses and top-end manufacturing
• Static, dynamic, high temperature or cryogenic operation

5 DESIGN AND ENGINEERING

From analysis of your requirements...
to custom production...
• The experience and expertise of an in-house engineering department

6 SPRING MATERIALS

An extensive range of spring materials, usable from -270°C to +1000°C.

9 WAVED SPRING WASHERS

From ball bearing pre-stress to custom applications • Use a minimal volume to store and restitute maximal energy

17 ONDUFIL™ SPRING WASHERS

Simultaneously waved and rolled from flat wire to provide greater deflection than an ordinary waved washer by increasing the number of turns

29 SPECIAL PRODUCTS

Specific elasticity curves, special dimensions, particularly corrosive environments... Our special products provide innovative spring solutions

34 ENGINEERING SHEET

Photocopy or download this sheet from our website to set out your basic requirements, so that our engineering department can check the feasibility of your ideas

INTRODUCTION

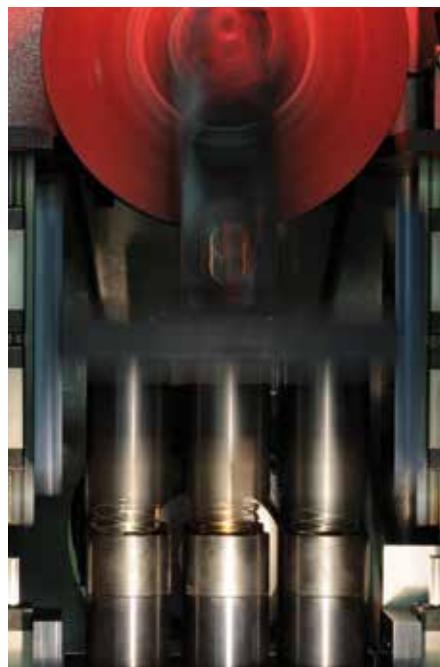

ALWAYS STRIVING TO INNOVATE

Borrely has specialised in designing and producing spring washers since the early 1970s. Dominique Borrely took the reins of the company in 1990 and has continued its growth through a policy of continual innovation. Numerous investments in human and technical resources ensure that the company's products are at the leading edge of technology.

Borrely aims to achieve sustainable

national and international development, and has set up appropriate facilities to attain its objectives:

- Several functional production units suited to innovative manufacturing techniques.
- An inspection laboratory equipped with optical, static and dynamic measurement equipment.

HIGH-TECH EXPERTISE

Borrely designs and develops very high quality technical products. Its spring washers are round elastic parts which can store a maximal amount of energy for their unit volume and which are ideal for highly complex problems. The in-house engineering and research department studies every requirement and solution individually, and proposes tailored manufacturing and production processes right from the design stage.

The company's high-tech expertise is attested by EN 9100 and ISO 9001 certifications, obtained in 2004 and renewed in 2007.

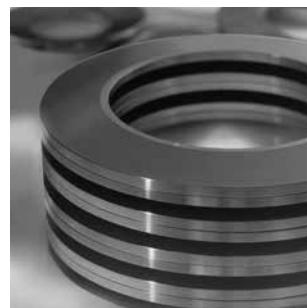

This is why Borrely has been selected as a preferred partner by numerous major players in industries from aeronautics and aerospace to Formula 1 motorsport and nuclear power.

AN EXTENSIVE RANGE OF SPRING WASHERS

Awell as offering custom design services, Borrely has an extensive range of over 2,000 standard spring washers

available from stock in carbon and stainless steel base materials, and over 1,500 tools. From receipt of materials to domestic and international shipping,

all administrative and production operations are clearly defined and managed by Borrely.

DESIGN AND ENGINEERING

FROM ANALYSIS OF YOUR REQUIREMENTS...

Designing a spring washer requires thorough knowledge of the product, acquired through years of experience. Our in-house engineering department builds on this experience through its familiarity with high-performance computational software.

In terms of energy stored per unit volume of material, spring washers are among the most efficient types of spring.

We work with you to consider your needs and draw up requirement

specifications in order to determine the most technically and economically suitable solution.

We analyse your environments and adapt the material used to suit even the harshest constraints.

We can very quickly manufacture prototypes which can be subjected to static and dynamic tests.

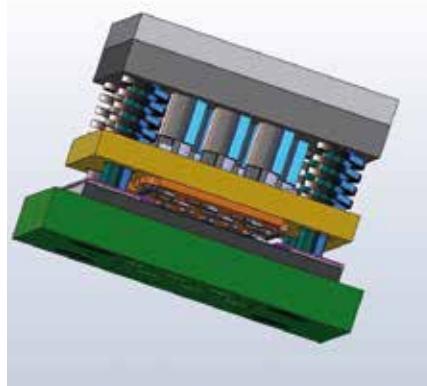

Forty years of experience guarantees that you can have confidence in our expertise.

Our in-house engineering department

works with you to determine the spring washer that best suits your requirements:

- Minimal dimensions
- Special environments
- Cryogenic or very high temperatures
- Static or dynamic fatigue
- Standard spring materials or super-alloys
- Development, testing
- Prototypes and large production runs

...TO CUSTOM INDUSTRIALISATION...

Our experience enables us to choose the most suitable spring for your needs from our existing range of products.

All phases in the manufacturing of our standard and special products are carried out in our factories:

- Design
- Manufacturing of tooling
- Cutting - stamping
- Heat treatment

GENERAL CHARACTERISTICS OF THE MATERIALS USED

The first phase in designing a spring washer entails determining the material that best meets the stipulated requirement specifications.

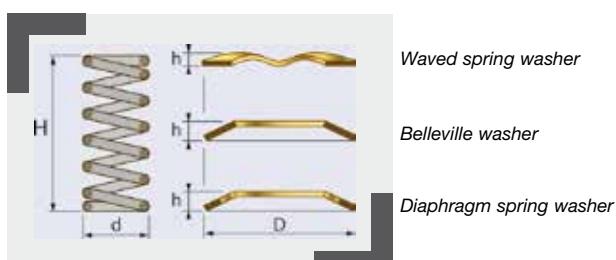

Usual description AFNOR symbol	Standard	Werkstoff Nr. (DIN) AISI	Young's modulus E (at 20°C). GPA dynamic method	Elastic limit (kgf/mm ² (at 20°C).) Mpa	Service temperature (°C)	Resistance to corrosive substances	Fatigue resistance

GENERAL CHARACTERISTICS AND ADVANTAGES OF SPRING WASHERS

Low volume

Spring washers, like wound wire springs such as coil springs, are round elastic parts.

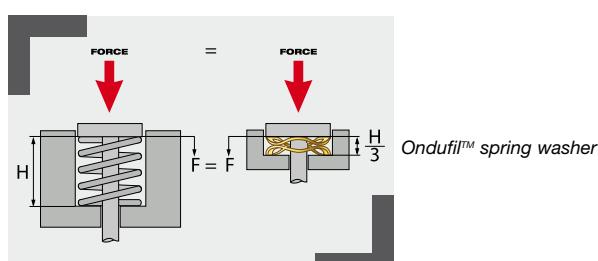

Unlike coil springs which are “tall” compared with their diameter, spring washers are “short” compared with their diameter.

Spring washers are therefore used when a “round elastic part” is needed in an assembly and there is space available for its diameter but not for height.

Our engineering department will determine the elastic part that best suits your requirements.

Comparison with a coil compression spring

Identical deflection and force are achieved in one-third of the volume.

This table is not intended to be exhaustive. It lists the materials regularly used which have a favourable ratio of elastic limit to longitudinal modulus of elasticity for relatively high elastic deformations.

Usual description AFNOR symbol	Magnetic permeability	Electrical or thermal conductivity	Field of use	Supply
Carbon steel C75S / CK75	Very good	Low	Waved spring washers, diaphragm spring washers, Ondufil™, spring rings, in a sealed, well lubricated housing	Always in stock
Chromium-molybdenum steel 51CrV4	Very good	Low	These steels are selected if high carbon steels are unsuitable due to fatigue resistance or special heat treatment requirements.	Regular
Lightly alloyed steel 45Si Cr Mo 6	Very good	Low	Thick Belleville washers requiring high internal stress ratios	Regular
Austenitic stainless steels	X10 Cr Ni 18-8	Low due to work hardening	Waved spring washers, Belleville washers, diaphragm spring washers, Ondufil™, spring rings, located in a non-waterproof housing and subject to even lightly corrosive substances.	Always in stock
	X5 Cr Ni 18-10	Low due to work hardening	Ondufil™ spring washers requiring low elasticity and good corrosion resistance.	Difficult
	X6 Cr Ni MoTi 17-12-2	Low due to work hardening	Ondufil™ spring washers in particularly corrosive environments.	Regular
	Structurally hardened stainless steel - 17-7 - Ph X7 Cr Ni Al 17-7	Good	Waved spring washers, Ondufil™ in corrosive environments, high temperatures.	Difficult
Martensitic stainless steel - 17-4 - Ph X5 Cr Ni Cu Nb 16-4	Zero	Low	Large Belleville washers in corrosive environments.	Difficult
Inconel X 750 super alloy Ni Cr15 Fe7 Ti Al	Zero	Low	Waved spring washers, Belleville, diaphragm spring washers, Ondufil™, high temperature parts.	Very difficult
Inconel 718 super alloy Ni Cr19 Fe19 Nb5 Mo3	Zero	Low	Waved spring washers, Belleville, diaphragm spring washers, Ondufil™, spring rings for nuclear, aeronautical, space, very high temperature.	Always in stock
NIMONIC 90 super alloy Ni Cr20 Ti Al	Zero	Low	Belleville washers only for high-temperature nuts and bolts, gas turbines, aeronautical.	Very difficult
Beryllium copper CuBe 2	Zero	Very high	Waved spring washers, Belleville, diaphragm spring washers, Ondufil™, spring rings. Cryogenic media.	Always in stock

Using all possible means of compressing materials

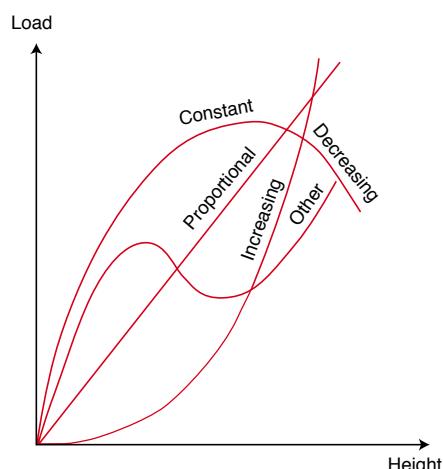

In a standard helical spring, the material is only compressed in torsion, which implies that force is always proportional to displacement (except if complex methods such as non-cylindrical windings, varied winding spacing or variable diameter wire are used).

The same does not apply to spring washers which, being flat springs, can use flexion, torsion and shear compression. By combining different compression types as the deformation varies, the forces obtained do not need to be proportional to displacement, enabling the elasticity curve to vary to achieve the desired force.

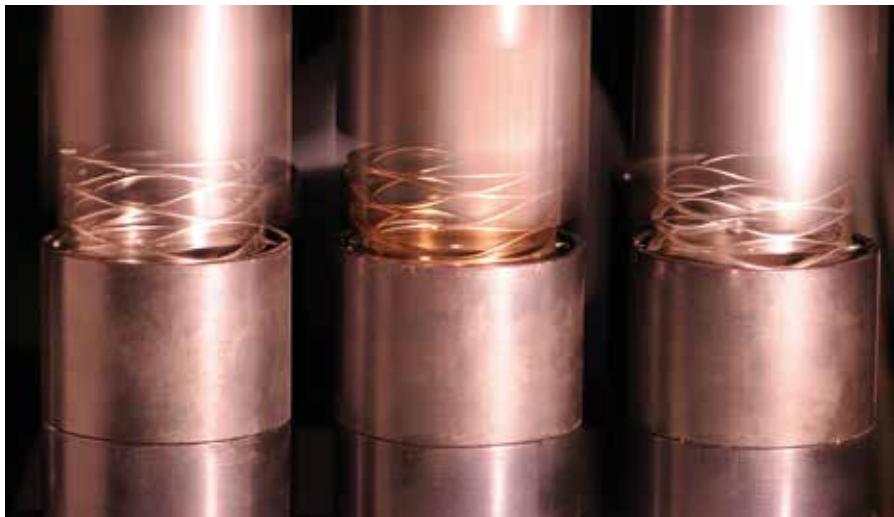

It is possible, for example, to design spring washers for which the force increases throughout the first part of deflection, then remains constant during the remaining displacement. Likewise, spring washers can be designed to have a force that increases to a maximum value then decreases. If only the falling part of the elasticity curve

is used, the result is a spring that "gets stronger as it releases".

There are many applications for this specific feature.

INSPECTION...

From dimensional inspection and appearance tests to materials resistance and static or dynamic loading tests, our laboratory is fully equipped to check that all products we supply comply with their specifications.

In accordance with ISO 9001:2000 and EN 9100 procedures, all our inspection equipment is traceable to national metrological standards and is regularly calibrated.

Total traceability is guaranteed and records can be archived indefinitely. Batch numbers are linked to full manufacturing details: materials, all production phases, intermediate inspections, final inspection and shipping.

...SHIPPING

Shipping your parts is of the utmost importance to us. Because appearance does indeed count, we use resistant, correctly labelled, easy to handle and secure packaging guaranteed to provide total protection for your products.

We can adapt our packaging (GALIA), labelling and barcodes to cater for special requirements.

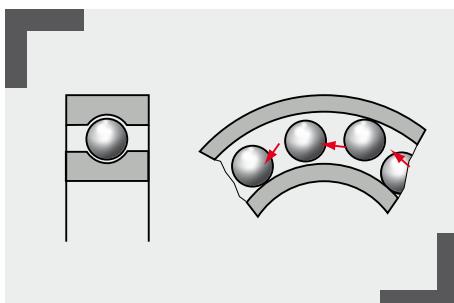

WAVED spring washers

WAVED SPRING WASHERS

GENERAL: BALL BEARING NOISE

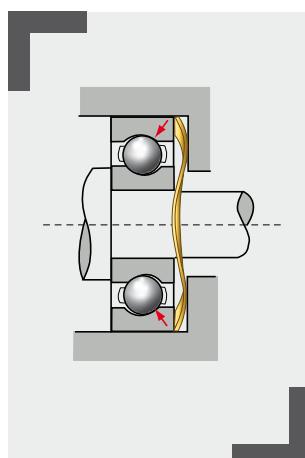

Non pre-stressed ball bearing

Internal clearance in ball bearings is essential but generates noise and vibrations.

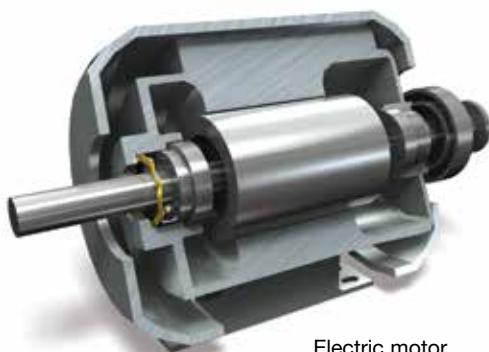

Pre-stressed ball bearing

Using spring washers to take up internal clearance reduces vibrations considerably and also decreases bearing noise. This has a beneficial effect on bearing service life.

APPLICATIONS

Examples of bearing applications

Electric motor

Tighter clearance, controlled force

Aerospace

- Problem to be solved:**

Handle pre-stress in a high speed turbine.

- Constraints:**

Cryogenic operating temperatures, particularly small overall dimensions, very tight load tolerance, zero hysteresis.

- Solution:**

Beryllium copper waved spring washers.

- Borrely added value:**

Characterisation of the design parameters and parameters for manufacturing at 20°C, to achieve a result that fully met the customer's requirements at 50 K, right from the first prototype.

Civil aeronautics

- Problem to be solved:**

Guarantee locking of a multi-pin connector ring.

- Constraints:**

Very small overall dimensions, very high forces and deflections, stainless steel required. Zero defects guaranteed.

- Solution:**

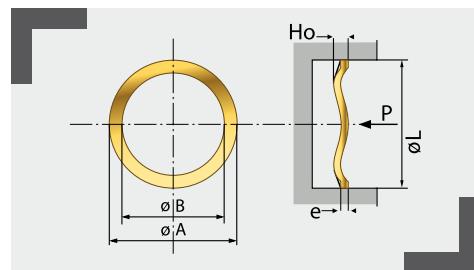

Ondufil™ stainless steel open spring washer.

- Borrely added value:**

Determination of geometry, industrialisation and inspection methods.

CN STANDARD XC 75 AND STAINLESS STEEL WAVED SPRING WASHERS

OE SPECIAL WAVED SPRING WASHERS WITH EXISTING TOOLS

These tables are not restrictive. They are provided to avoid unnecessary expensive tooling costs. Unlike our standard range, we do not keep these washers in stock. They can however be manufactured on request with very short lead times.

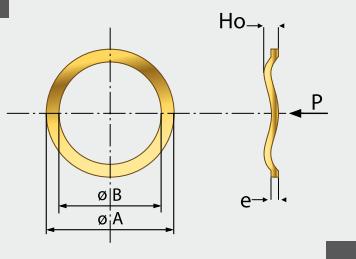

The values in the tables are not binding. Data is provided for information only and subject to change without notice.

ONDUFIL™ spring washers

ONDUFIL™ WAVED SPRING WASHERS

GENERAL

ONDUFIL™ spring washers are round elastic parts, in the same family as our waved spring washers, Belleville or diaphragm spring washers. They are produced using a new manufacturing technology that entails simultaneously winding and rolling a flat wire corresponding to the width of the coil.

Based on this technology, ONDUFIL™ spring washers offer a solution for new requirements including ever smaller dimensions, ever higher deflections in elastic deformation and increasingly varied stiffnesses.

Borrely has incorporated two additional structures to quickly and accurately meet your requirements:

- An engineering department with high-performance computational software.
- A production workshop for ONDUFIL™ spring washers, equally capable of producing prototypes and large series production runs.

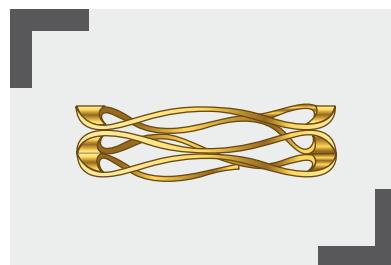

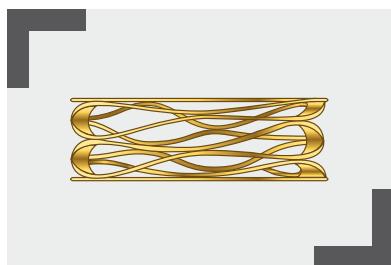

**Custom design,
no tooling expenses.
Manufacturing, inspection
and shipping included.,**

Single-turn spring washers

Inverted wave spring washers

Nested spring washers

MATERIALS

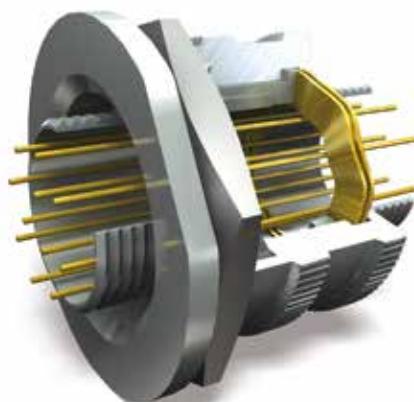

Common uses	Carbon steels	• XC75
	Stainless steels	<ul style="list-style-type: none">• Werkstoff 1.4310 (Aisi 301) Z10CN 18.08• Werkstoff 1.4568 (17.7ph) Z7CNAL 17.7• Werkstoff 1.4571 (Aisi 316Ti) Z6CNDT 17 12
Special applications	Cube 2 - Inconel - Monel - Hastelloy	Our engineering department will advise you regarding any specific requirements (environment, temperatures, conductivity, non-magnetism, etc.).

ONDUFIL™ is a registered trademark of Borrely™.

ONDUFIL™ spring washers are used in numerous fields, including:

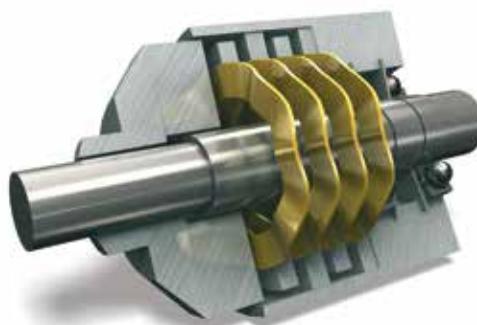

Sealing rings

Multi-pin connectors

Pre-stressed ball bearings

Clutch mechanisms

Sealing ring

- **Problem to be solved:**
Pre-stress a dynamic sealing ring in a chemical environment.
- **Constraints:**
Highly oxidising environment.
- **Solution:**
Hastelloy Ondufil™ spring washers.
- **Borrelly added value:**
Definition and production of prototypes parts within 8 days.

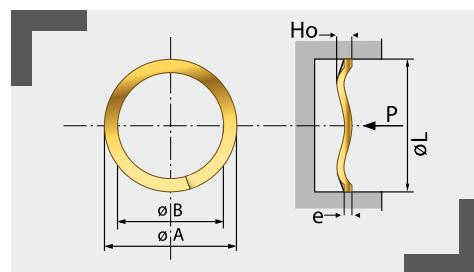

Automotive

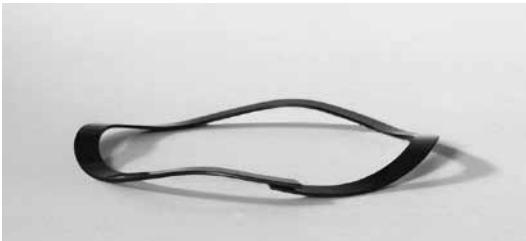

- **Problem to be solved:**
Release a latch in the event of an intrusion.
- **Constraints:**
Compact, salt spray resistance.
- **Solution:**
Ondufil™ spring washers.
- **Borrelly added value:**
Study of a technical part using appropriate materials, production of prototypes within 8 days, start of series production within 15 to 20 days. Guarantee 4 PPM on series of 2,000,000 parts.

ONDUFIL™ STANDARD XC 75 AND STAINLESS STEEL SPRING WASHERS

For pre-stressed ball bearings

BELLEVILLE washers

BELLEVILLE SPRING WASHERS

GENERAL

High class manufacturing quality

Borrely specialises in designing and manufacturing spring washers, including Belleville washers and special stackings. We offer our customers recognised expertise and a worldwide reputation in our field.

Our skilled teams can provide solutions for delicate problems in all high-tech fields, including the offshore, nuclear and aerospace industries.

For prototyping and small production runs, we regularly use materials designed to withstand extreme

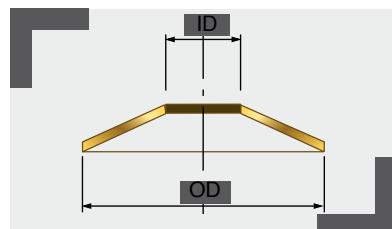

environments (high or cryogenic temperatures, chemical substances), such as:

- Inconel 718
- Beryllium copper
- Austenitic and martensitic stainless steels
- Structurally hardened stainless steels
- Special steels such as 45SCD6, 50CV4, XC75
- Composite materials
- Inconel 750
- Titanium
- Nimonic 90
- Hastelloy

Our in-house engineering department, equipped with high-performance computational software, quickly responds to your constraints and provides solutions tailored to your requirements.

Centring

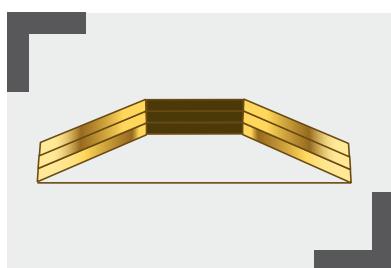

Belleville-type spring washers may be centred either by the inner or outer diameter.

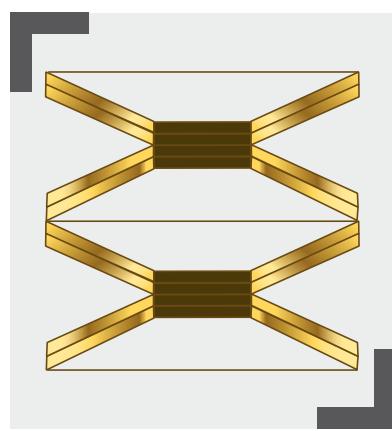

Stackings

- **Parallel:** forces are cumulative, deflection is equal to that of a single washer.
- **Series:** deflections are cumulative, force is equal to that of a single washer.

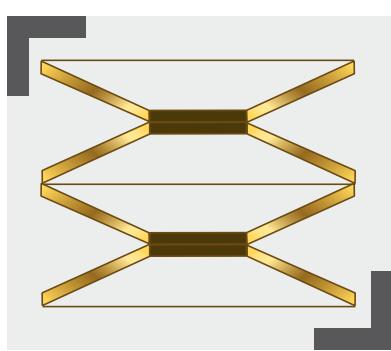

- **Mixed:** parallel-stacked groups of washers may in turn be stacked in series.

Parallel stacking

Mixed stacking

Series stacking

- Problem to be solved:**

Guarantee safety on petrol industry extraction valves.

- Constraints:**

Very small overall dimensions, very short lead times, existing washers broke due to fatigue.

- Solution:**

An innovative manufacturing process for stacking Belleville-type spring washers.

- Borrely added value:**

Borrely was selected after proposing and creating an innovative solution which guaranteed operation complying with the customer's requirements.

Industrial valves

- Problem to be solved:**

Attenuate noise from a rotary hammer on an impact driver, whilst delivering sufficient energy to operate the system.

- Constraints:**

Combine spring function with reduced noise and improved comfort of use.

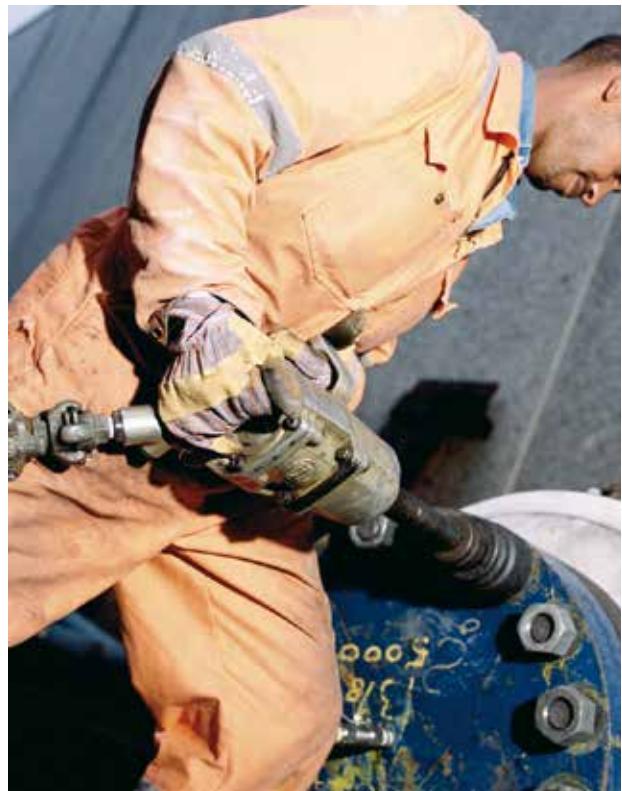

- Solution:**

Belleville-type spring washer using composite materials.

- Borrely added value:**

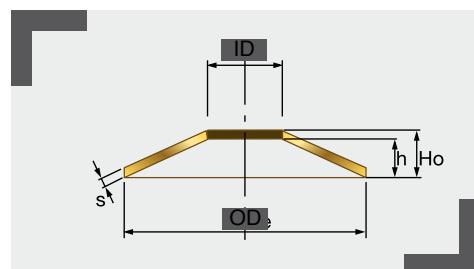

Prototyping of washers followed by fatigue testing. Materials developed specifically for noise reduction and impact shock absorption applications.

Impact driver

BELLEVILLE SPRING WASHERS - DIN 2093

SPECIAL products

SPRING RINGS

PRINCIPLE OF SPRING RINGS

Spring rings are waved spring strips, mounted between a bearing and its housing and used to control the clearance between the two.

The spring ring is pre-stressed on fitting, meaning that the bearing can only move radially if the pre-stress force is exceeded.

We can manufacture spring rings from steel, stainless steel, Cube 2, Inconel, etc. with short lead times and no tooling expenses.

BALL BEARING APPLICATION TABLE

* For a stainless steel washer, replace the characters "XT" by "IX" at the end of a reference.

SPECIAL SPRINGS

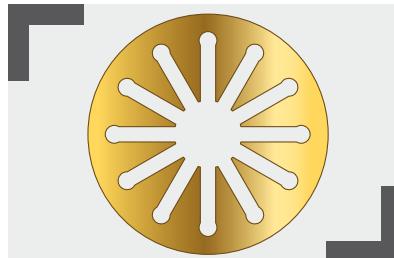

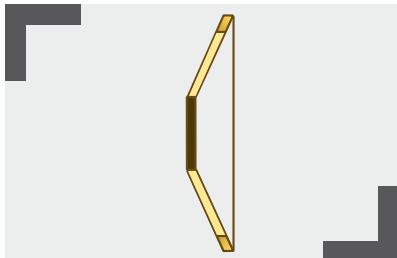

Special springs are elastic parts with specific shapes. They are used to obtain forces, retain mechanical parts and compensate for play with an extensive range of dimensions.

The examples below are not restrictive. Send us a description of your needs, with a diagram, requirement specifications or a prototype, and we will quickly inform you of the possible solutions we can offer.

DIAPHRAGM SPRING WASHERS

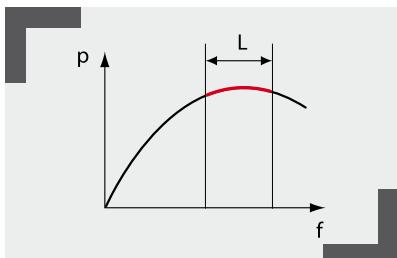

GENERAL

Diaphragm spring washers are a special type of Belleville washer.

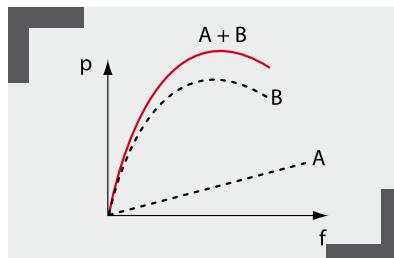

Elasticity curves

The elasticity curves are much the same as for Belleville washers, but with a much higher deflection.

Advantages

- Wide range of possible elasticity curves
- High force values
- Can perform the function of a multiple-turn spring, with an elasticity curve perfectly suited to the problem at hand.

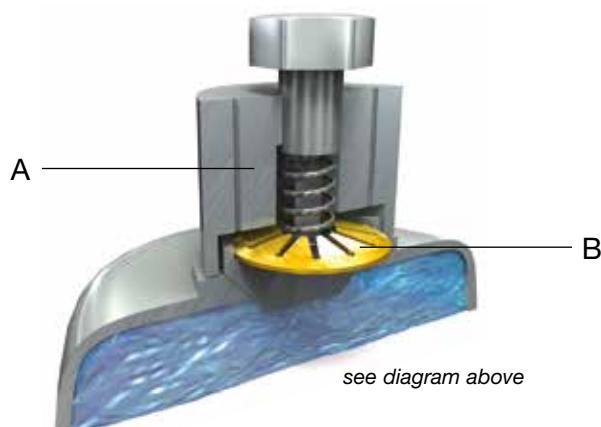

Centring and stacking

In principle diaphragm spring washers are not stacked; indeed, one of their primary purposes is to avoid stacking.

APPLICATIONS

Boiler safety valve

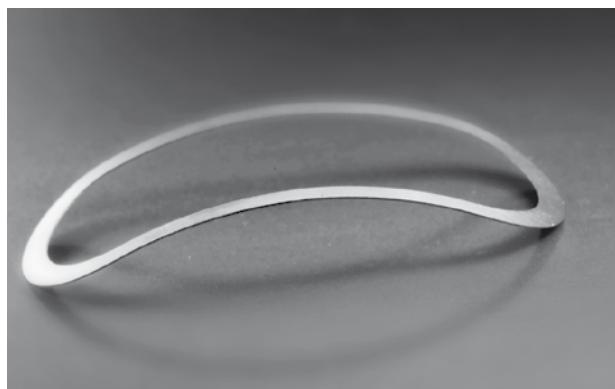

SPRING BLADES

GENERAL

If space is available for a contact surface, but not for height, spring blades can provide an elastic solution for rectangular, trapezoidal, and even oval shapes.

These blades store energy and restitute it in a very low volume.

We are specialised in designing and manufacturing spring blades in exotic materials such as Cube 2, Inconel and the like.

PRACTICAL EXAMPLES

Nuclear

- **Problem to be solved:**
Compensate for seal expansion on a heat exchanger in a nuclear environment.

- **Constraints:**
Small dimensions, radioactive environment.

- **Solution:**
Cube 2 spring blades determined from requirement specifications.

- **Borrelly added value:**
Determination of geometry, production of prototypes within one week, qualification within four weeks.

Automotive

- **Problem to be solved:**
Eliminate vibrations transmitted by the engine to the steering column.

- **Constraints:**
Obtain precisely defined mechanical characteristics for vehicle series.

- **Solution:**
Carbon-steel spring blades.

- **Borrelly added value:**
Prototypes entirely designed by Borrelly engineering department. Compatibility with existing parts was mandatory. Industrialisation.

FLAT WASHERS

Thickness 0.01 to 3 mm

The wide range of cutting tools used by Borrelly are also suitable for manufacturing flat washers in very short lead times for small or medium-sized production runs.

We regularly manufacture thin shim washers, with thicknesses from 0.01 mm to 3 mm, in a variety of materials such as work-hardened soft steel, tempered steels, stainless steels or other more exotic materials.

GENERAL

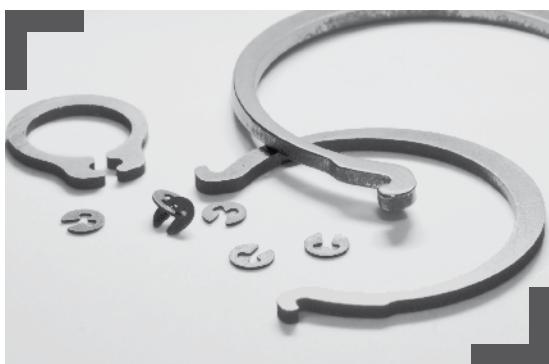

RETAINING RINGS

GENERAL

Known as retaining rings, circlips, or even spring rings, these mechanical assembly components are generally fitted in grooves on cylindrical shafts or in bores.

They are used for axial retaining, clearance take-up to reduce mechanical noise, and other similar functions.

We are specialised in designing and manufacturing highly specialised retaining rings, in small and medium-sized production runs, from materials such as austenitic stainless steels, Inconel, Cube 2, and more.
